BATCH 4 / DEMO OPERATOR

Live Demo and Backup Runbook

For use during the DEPI business pitch. Show the researcher-facing Telegram experience; all content fictional.

Before the room opens

- Keep ONLY the Phase 4 Telegram-trigger workflow published. Test /start and ensure Cloudflare tunnel is running if using a temporary URL.
- Open tabs: Telegram Web/Desktop, n8n Executions, LangSmith ResearchVoice-AI-Graduation, and slide deck. Do not display credentials.
- Prepare an approved synthetic study with Age (integer, years) and HbA1c (decimal, percent). Have a fictional case code ready.
- Confirm the Telegram account is a private chat. Disable notifications and hide unrelated contacts; never use identifiable clinical records.
- Record a complete backup video separately. This document is only the shot list; no video is supplied until the team records it.

Live path — expected time 3–4 minutes

Step	Operator action	Expected visible proof
1	/start and /studies; select approved demo study	Study selected, prompts for case code
2	Enter DEMO-PITCH-001 and explicit YYYY-MM-DD visit date	New synthetic visit created
3	Type: The patient is 54 years old and HbA1c is 6.2 percent.	Transcript confirmation buttons
4	Press Confirm Transcript	Extraction and independent QA run, then Final Review
5	Read Age 54; HbA1c 6.2 percent. Correct any mismatch manually.	No unsupported value silently approved
6	Press Confirm & Export	An XLSX arrives through Telegram
7	/eval and /monitor; optionally open LangSmith recent QA checkpoint	Judge scores, monitoring summary, trace visible

Voice demonstration: optional, not required for reliable live path

If voice is used, type /voiceon first to acknowledge that audio is sent to Groq before words can be screened. Speak only the fictional two-variable sentence; show transcript confirmation, and be prepared to correct a transcription error. Avoid making voice recognition a single point of failure for the pitch.

Fallback decision tree

Issue on screen	Presenter response
Telegram bot silent	Switch to pre-recorded backup clip; explain temporary Cloudflare/webhook dependence.
Voice transcription mismatch	Show it as a safety-positive review case; manually correct or switch to typed message.

Gemini/QA call delayed or fails	Show earlier completed screenshot/evidence, not a fabricated successful run.
LangSmith not updating	Show previously verified QA checkpoint and clarify that tracing is separate from approval/export.
Unexpected real personal data appears	Stop demo and avoid recording/sharing; use only synthetic input.

Backup video shot list

- Opening frame states SYNTHETIC DATA ONLY.
- Show selected study schema and case code without identifiers.
- Show typed or synthetic voice input + transcript confirmation.
- Show Final Review and optional correction.
- Show explicit approval and downloaded XLSX.
- Show /eval, /monitor and the LangSmith QA trace.
- Capture terminal confirmation of n8n execution only if it contains no keys or personal data.

Evidence to attach: file name of demo recording [PENDING], test date [PENDING], operator [PENDING], matching n8n execution ID [PENDING], anonymized screenshots [PENDING].
